

The World Economy

It is suggested that instead of using the Artificial Intelligence (A.I.) to identify & data track every person on the planet, that the A.I. should be used to track financial transactions.

It would be of great use to Humanity to eradicate the fraud in the Word Economy & the self learning A.I. should be able firstly to analyse sections of economic activity & then suggest alternative means of control. As all banks use computers to interact it should be relatively easy to tap into the banking system.

A further assessment of International financial interactions could be undertaken on every area of human financial evaluation from personal wage assessment to Oil, Gas & energy costs.

The outcome would hopefully be to remove the direction & investment in War & Fraud in the world economy & direct investment to worthy causes like; free energy, waging the population in an equal way & then bonusing people for their work for helping; society, other people, humanity & evaluating the value of consumer goods internationally.
